WHAT IS CLAIMED IS:

A lighting device, comprising:
an organic electroluminescent element; and

a transparent substrate, said substrate having a first principal plane on which light from said organic electroluminescent element is incident and a second principal plane,

the light incident on said substrate comprising a first light emitted from the second principal plane of said substrate, and a second light emitted from a third plane different from the first principal plane and the second principal plane, the first light illuminating a first object and the second light illuminating a second object different from the first object.

- 2. The lighting device according to claim 1, further comprising a reflector member that reflects a portion of the first light, a third light reflected by said reflector member illuminating the second object to be illuminated by the second light.
- 3. The lighting device according to claim 1, further comprising a reflector member that transmits a first light component of the first light having a specific wavelength, and that reflects a second light component different from the first light component, the first light component illuminating an object and the second light component illuminating an object different from the object illuminated by the first light component.
- 4. The lighting device according to claim 1, said organic electroluminescent element comprising a pixel region on which the first light is generated to display arbitrary information, and an illuminator region on which the second light is generated to illuminate an object to be illuminated.
- 5. An electronic device, comprising: the lighting device according to claim 1; a display unit illuminated by the first light to display arbitrary information; and

a key input unit illuminated by the second light.
